

Download Adjoint Of Matrix 2x2

The adjoint of a matrix (also called the adjugate of a matrix) is defined as the transpose of the cofactor matrix of that particular matrix. For a matrix A , the adjoint is denoted as $\text{adj}(A)$. On the other hand, the inverse of a matrix A is that matrix which when multiplied by the matrix A give an identity matrix. Adjoint matrix is also referred as Adjunct matrix or Adjugate or classical adjoint matrix. 'Adjoint' of a matrix refers to the corresponding adjoint operator, which is its conjugate transpose. The adjugate matrix is also used in Jacobi's formula for the derivative of the determinant. Use our online adjoint matrix calculator to find the adjugate matrix of the square matrix., Adjoint Of Matrix 2x2.
