Multi-step inequalities are solved just like multi-step equations except that you have to be aware of when to reverse the inequality symbol. The symbol should be reversed if: 1) You reverse the sides of the equation. or. 2) You multiply or divide both sides by a negative number. Solve Multi-Step Inequalities As the previous examples have shown, we can perform the same operations on both sides of an inequality, just as we do with equations. To isolate the variable and solve, we combine like terms and perform operations with the multiplication and addition properties.
