

Download One Example Of Homeostasis In The Body

The human body is full of examples of homeostasis. Common Homeostasis Examples . Here are some homeostasis examples: Humans' internal body temperature is a great example of homeostasis. When an individual is healthy, his or her body temperature retains a temperature 98.6 degrees Fahrenheit. The body can control temperature by making or releasing heat. Another one of the most common homeostasis examples in humans is the regulation of body temperature. Normal body temperature is 37 degrees C or 98.6 degrees F. Temperatures way above or below these normal levels cause serious complications. When homeostasis is interrupted, the body can correct or worsen the problem by internal and external influences. Examples of homeostasis in the human body 1- Internal body temperature . The internal body temperature of humans is a great example of homeostasis. When an individual is healthy, their body temperature is maintained at 37 °. Water Levels In The Body: Yet another example of homeostasis is the regulation of water levels in the body. Although more than half of the body's weight is water weight, the cells of the body must have a balance of water within them., One Example Of Homeostasis In The Body.
