

Download Speed Distance Problems

The rate is the speed at which an object or person travels. It is usually denoted by r in equations. Time is the measured or measurable period during which an action, process, or condition exists or continues. In distance, rate, and time problems, time is measured as the fraction in which a particular distance is traveled. $\text{Time} = \text{Distance} / \text{Speed}$. Time taken to cover 8000 meters distance at the speed of 1000 meters per minute is $= 8000 / 1000 = 8$ minutes. Hence, if the person increases his speed by 10 kms per hour, he will take 8 minutes to cover 8000 meters distance. Let us look at the next question on "Time distance speed problems with solutions pdf" Make customizable worksheets about constant (or average) speed, time, and distance, in PDF or html formats. You can choose the types of word problems, the number of problems, metric or customary units, the way time is expressed (hours/minutes, fractional hours, or decimal hours), and the amount of workspace for each problem. Let us take a look at some simple examples of distance, time and speed problems. Example 1. A boy walks at a speed of 4 kmph. How much time does he take to walk a distance of 20 km? Example 4. If a person walks at 4 mph, he covers a certain distance. If he walks at 9 mph, he covers 7.5 miles more ..., Speed Distance Problems.
