

Download What Is A Reflection In Math

Reflect point across x axis, y axis and other lines. A reflection is a kind of transformation. It is basically a 'flip' of a shape over the line of reflection. Very often reflections are performed using coordinate notation as they all are on this page. The coordinates allow us to easily describe the image and its preimage. Reflections are everywhere ... in mirrors, glass, and here in a lake. Every point is the same distance from the central line ! The central line is called the Mirror Line ... Reflection in Math usually of a figure takes place over either the x-axis or the y-axis. You can Reflect on a Coordinate Grid by changing the sign on the x or y coordinates depending on which axis you reflect over. A reflection in math is when a shape is flipped over the x or y axis by counting how many units the points are away from the axis and putting the point on the other side the same distance away., What Is A Reflection In Math.
