A circle's circumference and radius are proportional. The area enclosed and the square of its radius are proportional. The constants of proportionality are 2π and π , respectively. The circle that is centred at the origin with radius 1 is called the unit circle. Thought of as a great circle of the unit sphere, it becomes the Riemannian circle. Area of a circle. The area of a regular polygon is half its perimeter multiplied by the distance from its center to its sides, and the corresponding formula (that the area is half the perimeter times the radius, i.e. $\frac{1}{2}P \times r$) holds in the limit for a circle. Area of a Circle. The area of a circle is the number of square units inside that circle. If each square in the circle to the left has an area of 1 cm^2 , you could count the total number of squares to get the area of this circle. Thus, if there were a total of 28.26 squares, the area of this circle would be 28.26 cm^2 . However, ... The Circle and Parts of a Circle. The common distance of the points on the curve from the center is called the radius. The region bounded by the circle is also often referred to as a circle (as in when we speak of the area of a circle), and the curve is referred to as the perimeter or the circumference of the circle., What Is The Area Of A Circle Called.
